

AGENT VISIBILITY AUDIT™ · AUTHORITY REPORT

Bastion-One

What AI agents know, what they get wrong, and the plan that fixes it.

PREPARED FOR **Bastion-One**

AUDIT DATE **AUGUST 7, 2026**

METHODOLOGY **ONPOINT AUTHORITY INDEX™**

CONFIDENTIAL

onpointhq.com

The Verdict

We asked the leading AI engines one question: *“What is Bastion-One and what do they do?”* Their answers were scored against ground truth. The result: what they say is largely accurate — but they barely say anything, and they cannot tell you apart from companies that share your name. Accurate, invisible, indistinguishable. That is the gap this report closes.

Where You Stand

Two forces decide your standing with AI agents: **presence** — how much they know — and **accuracy** — how true it is. Authority lives where both are high. You sit deep in the Underexposed quadrant: what little the engines hold is mostly right, which means the path to Authority is presence-building, not damage control. That is the faster, cheaper side of this map to climb from.

From Invisible to Verifiable

9 actions, ranked by impact. Each one gives AI agents something they can find, parse, and repeat. Executed in order, they move the score; measured quarterly, they prove it.

1 Deploy comprehensive Schema.org markup on bastion-one.com

Add Organization schema (name, url, logo, description, founder, sameAs linking to LinkedIn company page, Crunchbase, and any social profiles), Person schema for founder Andy Stahl (jobTitle, worksFor, sameAs to personal LinkedIn, patent records, and any press), and if applicable Product or Service schema describing offerings. Include disambiguatingDescription fields that explicitly state 'Bastion-One is a B2B AI governance and compliance company, not related to the Overwatch video game character Bastion.' This single action is the fastest path to entity resolution by Google's Knowledge Graph and LLM retrieval systems.

Web and SEO

effort: medium

impact: high

2 Build a crawlable, content-rich About page and Founder page on bastion-one.com

Create a dedicated /about page with 500+ words covering: what Bastion-One does, the problem it solves, target industries, founding story, and team bios. Create a separate /team/andy-stahl page with verifiable credentials—patents filed, prior companies (Stahl-AI, Stahl Industries), speaking engagements, certifications, and professional history. Both pages must be linked from the site navigation and include the Schema markup from Priority 1. This gives AI agents and search crawlers the minimum viable content needed to build an entity understanding.

Content

effort: medium

impact: high

3 Claim and optimize third-party entity profiles to create corroborating signals

Create or update profiles on LinkedIn (personal and company page), Crunchbase, Google Business Profile (if applicable), Wikidata (create a Wikidata item for Bastion-One with instance-of = technology company, founder, official website, and description), and any relevant industry directories (e.g., AI governance vendor lists, GovTech directories). Each profile must use the exact canonical name 'Bastion-One' and link back to bastion-one.com. These corroborating cross-references are what LLMs and knowledge-graph systems use to validate that an entity is real and distinct from the gaming character.

Founder	effort: low	impact: high
---------	-------------	--------------

4 Publish a press release and secure 2-3 indexed media mentions

Issue a press release via a wire service (e.g., PR Newswire, Business Wire) announcing Bastion-One's mission, founder background, and any product milestones or patent filings. Pitch founder profiles or bylined articles to at least two niche-relevant outlets (e.g., AI governance blogs, compliance trade publications, cybersecurity media). The goal is to create 3+ independently indexed web pages that mention 'Bastion-One' in a B2B context with links to the website, breaking the monopoly that gaming content has on the entity name in search results.

Content	effort: medium	impact: high
---------	----------------	--------------

5 Create a centralized Evidence Hub page consolidating all proof points

Build a /press-and-proof or /evidence page on bastion-one.com that aggregates: links to patent filings (USPTO, Google Patents), any podcast appearances, press mentions, conference talks, client logos or anonymized case studies, and partnership announcements. Embed or transcribe any audio/video content so it is crawlable as text. Mark up each item with Schema (Article, CreativeWork, or Review). This page becomes the single URL that AI agents and VC researchers can hit to verify the company's legitimacy and track record. Official proof pages: Create dedicated pages for: Patent details Security architecture Compliance mappings Leadership and company ownership Documentation Integrations Customer evidence Responsible disclosure/security contact Press and analyst resources

Web and SEO	effort: medium	impact: medium
-------------	----------------	----------------

6 Implement explicit entity-disambiguation content strategy

Add a brief disambiguation note in the site footer and meta description: 'Bastion-One is a B2B AI governance company. We are not affiliated with Blizzard Entertainment or the Overwatch character Bastion.' Publish a blog post or FAQ titled 'What is Bastion-One?' that naturally includes the phrase 'not the Overwatch character' alongside substantive descriptions of the company's services. This teaches LLMs and search engines to categorize the entity correctly when the name is queried in a business context.

Content

effort: low

impact: medium

7 Interlink related entities Stahl-AI, Stahl Industries, and Andy Stahl to Bastion-One

On any existing web properties for Stahl-AI or Stahl Industries, add explicit references and hyperlinks to Bastion-One (e.g., 'Andy Stahl is also the founder of Bastion-One'). On Andy Stahl's LinkedIn profile, list Bastion-One as current company with a full description. Use Schema sameAs and parentOrganization properties where relevant. AI agents that search for the founder by name will then discover Bastion-One through the entity graph, bypassing the name-collision problem entirely.

Web and SEO

effort: low

impact: medium

8 Establish a minimal but consistent thought-leadership publishing cadence

Publish one substantive piece per month—blog post on bastion-one.com, LinkedIn article, or guest post—covering AI governance, compliance automation, or cryptographic trust topics. Each piece must include the author's full credentials and a link to the Bastion-One website. Over 90 days this creates a growing corpus of indexed, topically relevant content that LLMs will begin to associate with the entity, shifting its momentum score from Stagnant to Rising and building the content depth needed for an AI agent to confidently recommend the company.

effort: high

impact: medium

9 Update the llms.txt

***Before updating Make one terminology decision: whether the primary category is “deterministic control plane for AI agents” or “AI track-and-trace and auditability.” Current file looks like it was automatically generated by some Yoast submission service. It includes two “Uncategorized” archives. Yoast automatically rotates recently updated content. The terminology shifts between “AI track-and-trace,” “deterministic control plane,” “AICS Control Engine,” “Agent Control Engine,” “AITS,” and “Audit Ledger.” It omits some strong pages, including metering, leadership, history, and foundational educational resources. It should ideally be served as text/plain; charset=utf-8 to remove encoding ambiguity. Yoast now supports manual page selection under Yoast SEO > Settings > Advanced > llms.txt. Yoast customization instructions I would recommend replacing the automatic selection with a curated version.

-------------	-------------	--------------

How We Measure

Every quarter we put your name to the leading AI engines, score their answers against documented ground truth, and track the movement. Same question, same method, same yardstick — so the trend line is evidence, not opinion.

LLM Confidence

How much substance AI engines can produce about you unprompted. Low confidence means agents change the subject — or invent one.

Entity Clarity

Whether engines can distinguish you from similarly named entities. The single biggest lever for a young or renamed brand.

Hallucination Risk

The share of claims with no basis in ground truth. Low risk with low presence means the record is thin, not wrong.

Contradictions

Conflicting claims engines repeat as fact — usually residue from rebrands, old bios, and unlinked identities.

NEXT CHECKPOINT • NOVEMBER 2026

Execute. Re-measure. Climb.

Your next audit re-runs the same engines with the same yardstick. The roadmap on page 04 is built to move the number — and the number is how we hold ourselves accountable.
